VMIVME-1182 Specifications

64-Channel Isolated Digital Input Board with Multifunctional Intelligent Controller

Features:
- 64 optically isolated inputs
- Multifunctions available per channel
  - Change-of-State (COS)
  - Sequence of Events (SOEs)
  - Pulse accumulation
  - Programmable debounce times
  - Time tagging
- 5 to 250VDC or 4 to 240VAC
- 1,500VDC or 1,100VRMS channel-to-channel and channel-to-VME isolation
- Pulse accumulation (0 to 65,535 pulses)
- SOEs monitoring on channel-by-channel basis
- Debounce times, software controlled on channel-by-channel basis
- 1.0ms measurement interval
- COS functions, software controlled on a channel-by-channel basis
- COS selections: disabled, rising edge (low-to-high transition), falling edge (high-to-low transition) or any edge
- Short or standard, supervisory, nonprivileged or either access
- Interrupt level is user selected
- UIOC® compatible
- Complies with ANSI/IEEE STD C37.90.1-1989 surge protection when used with companion suppression panel (for example, VMIVME-3459)

Applications:
- Data acquisition systems
- Nuclear power plant monitoring
- Control systems
Change-Of-State (COS) Timing: The VMIVME-1182 latches the input signals every millisecond. After a programmable debounce time, if a valid COS is detected, it is time tagged by the millisecond timer and stored for processing. The debounce time can be from 1.25ms to 1.024s. Therefore, the minimum pulse time that can be reliably detected is 2ms.

If the VMIVME-1182 is programmed to detect COS on both rising and falling edges, the minimum time in each state is 2ms. Thus, 4ms is the minimum period of a continuous input signal.

Each input channel is independent and is processed separately, so activity on one channel has no effect on other channels. A COS on one channel can be detected and stored while the debouncer is timing on another channel. Since all inputs are latched simultaneously every millisecond and they are processed separately, there can be a minimum of 1ms between events that occur on different channels.

Change-Of-State Detection: State change detection can be programmed for rising edge (low-to-high transition), falling edge (high-to-low transition), or both rising and falling edges. In addition, COS detection can generate an interrupt or be disabled.

Time Tagging: Each Change-of-State event can be time tagged with a timer value of 0 to 65s and is initialized or preset by writing to the time tag register.

The timer value is updated every millisecond. When the timer value has reached its maximum value, it rolls over to 0 and notifies the host of a time tag rollover via a bit in the Control Register, or if desired, an interrupt may be issued.

Sequence-Of-Events: Each change-of-state (depending on change select options) can be time-tagged in the sequence-of-event buffer. The SOE buffer collects the channel ID, and the time (time tag register) in which the state changed. This buffer can contain 3,000 events. When the host is accessing the SOE buffer, the VMIVME-1182 will continue to monitor the inputs and store events in a mirrored SOE buffer. The additional buffer also provides 3,000 events of storage. This allows the user the ability to process the SOE data (without time constraint problems) and not lose any event data. The SOE logic can provide an interrupt to the host at the End-of-Buffer or an interrupt at a count provided by the user (programmable).

Pulse Accumulation: Each channel has an associated Pulse Accumulation Count (PAC) Register. These registers have values which represent the number of pulses which have been detected at the field input. A pulse is edge-recognized by either a state change from a 0 to 1 or a state change from 1 to 0. The user will be notified when the count in the PAC Register has reached its maximum value of 65,535 pulses. This condition is indicated by a flag set in the Control Register, or if desired, an interrupt may also be issued.

Inputs: The VMIVME-1182 can be ordered in the Voltage Sensing option or the Contact Sensing option. The input configurations for each of these options are shown in Figure 2.
The Contact Sensing option is provided with pull-up resistors to the wetting voltage pins. The Voltage sourcing option does not provide pull-ups.

There are eight wetting voltage input pins applied on byte boundaries. The inputs are provided on the P2 connector. An additional feature is the ability to drive the wetting input via channel 32 of the P3 connector. Through the use of jumpers (see Figure 3), channel 32 can be sacrificed as a channel and its HIGH input used to supply a wetting voltage to all channels. The LOW side of channel 32 can be jumpered to acquire Digital ground from the VMIVME-1182.

VME Access: Address modifier bits are jumper selected and decoded to support nonprivileged, supervisory, and either nonprivileged or supervisory board accesses.

Self-Test: Self-test is run automatically after a system reset and can also be run by activating the Test Mode bit in the CSR. A pass/fail value is stored in the Control Register space. The LED remains illuminated regardless of the pass/fail status of the self-test. The self-test is primarily an integrity check of the microcontroller and the onboard memory.

System Reset: After a system reset, the following default conditions exist:

- Input transfers with 1ms debounce
- LED illuminated
- Test Mode enabled

Front Panel Status LED: This indicator is illuminated after a system reset. The LED can also be turned ON and OFF under software control.

Interrupts: An interrupt can be issued on any level (software selectable) and a single byte vector will be placed on the bus when acknowledged. There is one ROAK interrupt for the board. The following conditions can initiate the interrupt:

- COS on any of the 64 channels
- Time-Tag Rollover
- Pulse Accumulation Rollover on any of the 64 channels
- SOE, End-of-buffer
- SOE buffer count equal to programmable maximum count provided by user

Each of these interrupt conditions may be enabled or disabled by the host.

Physical/Environmental Specifications

Dimensions: Standard VME double height board
- Height: 9.2 in. (233.4mm)
- Depth: 6.3 in. (160mm)
- Thickness: 0.8 in. (20.3mm)

Power Requirements: 2.0A (typical) at 5V plus any power dissipated in pull-up resistors

Airflow: Forced air cooling required

Temperature:
- Operating: 0 to +65° C
- Storage: -25 to +85° C

Altitude:
- Operating: 0 – 10,000 ft (3,048m)

Humidity:
- Operating: relative humidity 20% to 80%, noncondensing

Weight (Mass): 0.7kg maximum
